OPEN-SOURCE AI · 2026

Open-Source AI Project Challenge Platform 2026

Architecting the next generation of open, private, and decentralized AI.

GLOBAL DEVELOPER HACKATHON

$50,000 OPEN INNOVATION FUND

Made with GAMMA

THE PREMISE

AI infrastructure should be open by default

Closed APIs create privacy, lock-in, cost, and auditability risks. This platform gives developers a central place to build with open-weight models, agent harnesses, and local runtimes.

Who it serves

AI engineers, full-stack developers, research scientists, and open-source communities

How it stays open

Three core challenge tracks · 100% permissive open licensing · Live database persistence

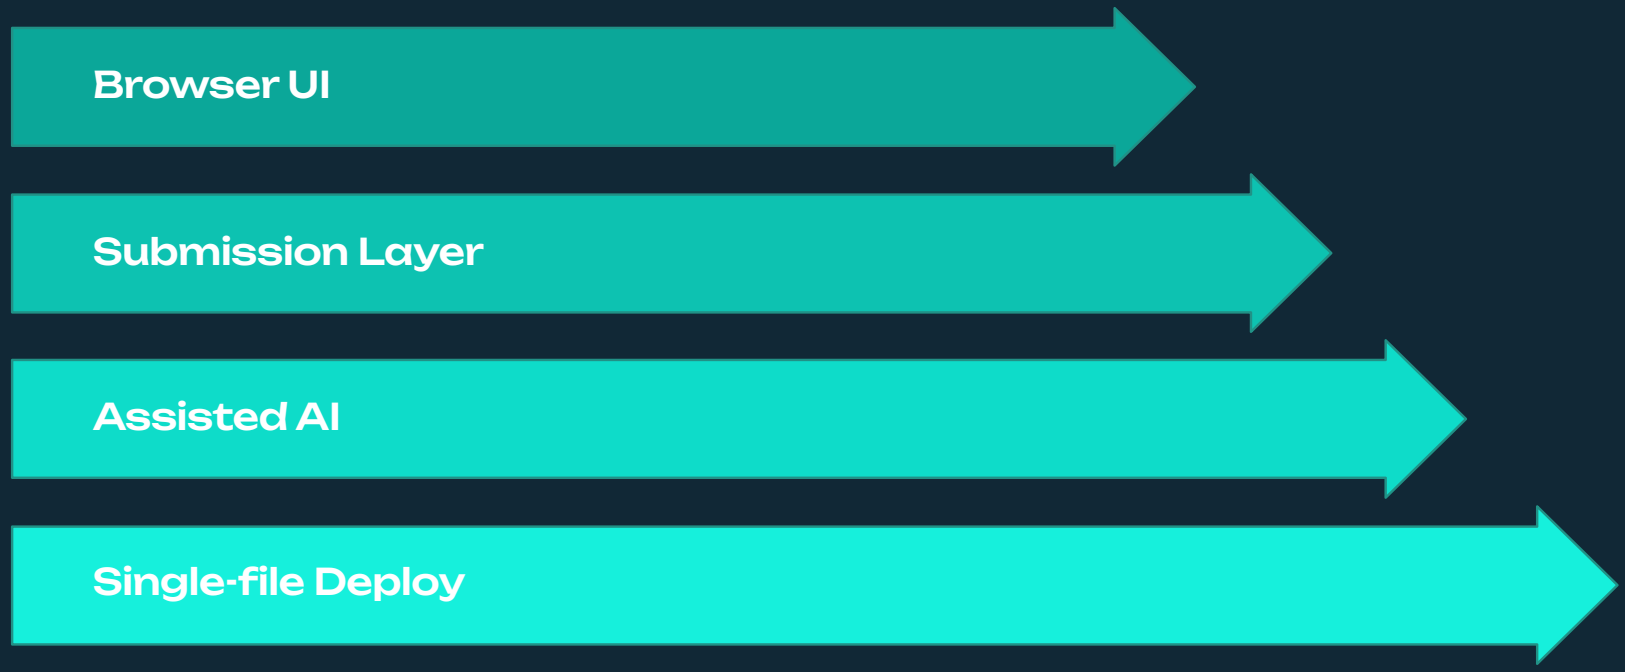

Made with GAMMA

PLATFORM ARCHITECTURE

A single platform connects the full open-source AI stack

Single-page HTML5 and Tailwind CSS power the interface; Supabase PostgreSQL persists submissions; a Gemini-powered assistant guides participants through rules and submission steps.

Single-file deployment for fast edge hosting

Made with GAMMA

THE CHALLENGE MAP

Three tracks cover the AI lifecycle

01 — Open-weight models

Gemma 2, Llama 3.3, Mistral NeMo, and Qwen 2.5

02 — Agent harnesses

LangChain, AutoGen, CrewAI, and LlamaIndex

03 — Local runtimes

Ollama, vLLM, llama.cpp, and LocalAI

Projects combining all three qualify for a multi-track hybrid prize.

Made with GAMMA

PUBLIC BY DESIGN

Transparency becomes a product feature

The live leaderboard makes every submission discoverable, filterable, and easy to inspect.

All tracks | Models | Agents | Runtimes

Search submissions...

Submission details

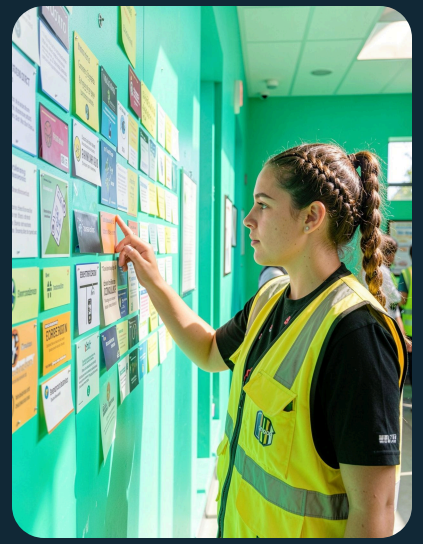

Team names · tags · timestamps · descriptions

GitHub repos · live demos

Live leaderboard

Async PostgreSQL queries · offline resilience

Track filters · instant client-side search

Made with GAMMA

SUBMISSION FLOW

Submission should feel like shipping

A focused modal captures the project, team, track, repository, optional demo, architecture, and description, then validates the payload before persistence.

01

Capture

Project, team, track, repository, optional demo, architecture, and description

02

Sanitize

Sanitize input and prevent XSS

03

Validate

Validate required fields and links

04

Persist

Persist to the database and return clear submission feedback

Made with GAMMA

PROPOSED FRAMING

Judging rewards useful, reproducible innovation

Proposed judging frame for the platform: evaluate technical depth, openness, usability, runtime performance, and the quality of the public demo.

Criterion	What the rubric should reward
Technical originality	New approaches with technical depth
Reproducibility and documentation	Open work others can inspect and run
Real-world usefulness	Projects that solve meaningful problems
Community value	Contributions that strengthen the open-source ecosystem

Use this as a proposed judging rubric to finalize with the organizing team.

Made with GAMMA

GUIDANCE IN THE FLOW

An AI assistant lowers the barrier to entry

The floating assistant helps developers navigate challenge rules, choose a track, understand submission requirements, and move from idea to public demo.

Contextual guidance inside the platform

Fast answers without leaving the submission flow

Designed to support, not replace, the developer

Made with GAMMA

DEPLOYMENT MODEL

Built to be public, private, and deployable

The platform pairs open-source participation with a practical deployment model: local inference options, auditable repositories, persistent records, and a lightweight single-file front end.

Public

Open code and public project links

Private

Local execution paths for privacy-sensitive workloads

Deployable

Edge-friendly delivery for global participants

Made with GAMMA

THE NEXT FRONTIER

Open the next frontier of AI development

Launch the challenge, attract builders across the stack, and turn every submission into a reusable contribution to the open AI ecosystem.

01

Finalize

the judging rubric and challenge rules

02

Activate

the three tracks and submission flow

03

Invite

the first global developer cohort

Made with GAMMA
